circadian rhythm meaning circadian rhythm circuit (uni football 5) Circadian rhythm polymorphism in a laboratory population of *Drosophila melanogaster* circadian rhythm: a 24 hour internal cycle in the organisms Circadian rhythms are internal cycles which are observed in organisms and microorganisms to take place with a period approximately 24 hours. The term circadian was chosen by the Father of chronobiology, William H. Cronin from the Greek *kyrios*, a "guardian" or a "watchman", for this type of coordination. circadian rhythm: a biological rhythm that occurs in organisms, each organism having a characteristic period of activity. The term "circadian" is used in reference to an internal clock that is responsible for maintaining a 24-hour cycle of activity. However, a similar concept was already used in ancient times. The tendency for an organism to have a characteristic and regular rhythm in behaviour, physiological function, or morphology. The characteristic natural rhythm of many organisms, which is caused by the periodic fluctuations in the production of hormones or other chemical substances, and which is characteristic of the species. As in Circadian rhythms, the term circadian refers to the cycle, whereas the term circadian rhythm refers to the rhythm in its free-running form. A definition of these terms may be found at the official Glossary of the Circadian Society. In plants, circadian rhythms have been reported in seed germination, leaf growth, flowering, stomatal movement, photoperiodic responses, root hair elongation, leaf coloring, and senescence. Likewise, rhythmic fluctuations in gene expression have been reported in plants. In animals, circadian rhythms have been reported in the measurement of many physiological and biochemical variables and the behavior of a variety of biological activities, such as body temperature and hormone secretions. Circadian rhythms have also been reported in animals as a result of endogenous biological clocks (ie, intrinsic timekeepers) located in various organs and brain regions. Because of their external nature, circadian rhythms are absent or poorly reported in invertebrates, especially insects. The first explicit report of a circadian rhythm in insects was published by Willi Hennig and Vladimir Anatolyevich Ivanov in 1973. In invertebrate animals, circadian rhythms have been reported, and experimental evidence exists for the existence of an endogenous clock that is independent of external signals. In insects
